

Norway Maple

This wood came from a tree that was planted in a schoolyard near Vermillion, South Dakota around 1905. Over the years the school was closed and the property sold. Eventually the building was turned into a home. Around 2010, the tree was struck by lightning; half of the crown exploded and the remaining half was leaning toward the building and had to be taken down.

A few years later we met the people who owned the property and they asked us if we would like to come and take the wood so they could reclaim the yard. It was not till we got it home and cut into it that we discovered some pieces had tiger striping.

There is no actual “Tiger Maple” species of tree. Any type of Maple can have this characteristic.
